Figure 1: Schematic representation of the experimental design. The diagram shows a sequence of events: a 1000 ms fixation cross, followed by a 1000 ms presentation of a stimulus (a word), then a 1000 ms presentation of a second stimulus (a word), and finally a 1000 ms presentation of a third stimulus (a word). The stimuli are presented in a sequence, with the first stimulus being a word, the second stimulus being a word, and the third stimulus being a word. The sequence is labeled 'Stimulus' and 'Response'.

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was significantly higher than the number of incorrect responses in all cases. The number of correct responses was significantly higher than the number of incorrect responses in all cases. The number of correct responses was significantly higher than the number of incorrect responses in all cases.

Figure 1. The effect of the number of trials on the number of correct responses. The number of correct responses was plotted against the number of trials for each condition. The number of correct responses increased with the number of trials for all conditions. The number of correct responses was highest for the condition with the highest number of trials (10 trials) and lowest for the condition with the lowest number of trials (2 trials).
